

TARGET

- TARGET is a multi-center, randomized clinical trial aimed at understanding how different treatments for rheumatoid arthritis (RA) affect cardiac inflammation.
- We hope that the results of this trial will improve cardiac outcomes in patients with RA by bringing to light if and how RA medications influence heart health.

Spondyloarthritis and Psoriatic Arthritis (SpA/PsA) Registry

- Create a national cohort of Spondyloarthritis patients cared for by rheumatologist to better understand the epidemiology and natural history of the disease, comorbidities, current treatment practices, response to therapy and outcomes related to medication therapy.
